OCTOBER 1992

SUSTAINABLE AGRICULTURE

THE DEPARTMENT OF PRIMARY INDUSTRY AND FISHERIES IS COMMITTED TO THE PRINCIPLES AND PRACTICES OF SUSTAINABLE AGRICULTURE

Definition:

Sustainable agriculture is the use of practices and systems which maintain or enhance:

- the economic viability of agricultural production;
- the natural resource base; and
- other ecosystems which are influenced by agricultural activities.

Principles:

- 1. Agricultural productivity is sustained or enhanced over the long term.
- 2. Adverse impacts on the natural resource base of agricultural and associated ecosystems are ameliorated, minimised or avoided.
- 3. Harmful residues resulting from the use of chemicals for agriculture are minimised.
- 4. The nett social benefit (in both dollar and non-dollar terms) derived from agriculture is maximised.
- 5. Agricultural systems are sufficiently flexible to manage risks associated with the vagaries of climate and markets.

1. INTRODUCTION AND SOME IMPORTANT NOTES

Standardised gross margin budgets for the Douglas-Daly region are presented in this booklet. They are a guide to the costs and returns that can be expected if specific conditions (relating to climate, prices, management, etc.) prevail. If these conditions are not met, then the gross margin estimates can be wide of the mark. That doesn't mean we're wasting our time, though. For instance, the budgets can be looked at more closely to see how variations in yields and prices affect cropping returns. They can also be used as a basis for assessing the risk associated with planting a certain crop measured in dollar terms. In any case, farmers are encouraged to prepare gross margin estimates based on their own situation, experience, and expectations since these are likely to be different from those assumed in the standardised budgets.

Standardised gross margin (GM) budgets provide a benchmark for comparing farm specific gross margins (eg. you can compare your GM for sorghum against the 'standardised GM' budget for sorghum) and are useful for comparing the profitability of different crops (eg. maize vs sorghum).

GM analysis is a <u>simplified budgeting technique</u> since it <u>ignores overhead costs</u>. Overhead costs can be safely ignored, however, if comparing activities of a similar nature (eg. no-till maize vs no-till sorghum) that use existing farm plant and equipment. If new capital equipment is required (eg. installation of irrigation equipment, purchase of minimum tillage equipment, purchase of livestock) or if activities are not of a similar nature (eg. fattening steers vs no-till maize), then more complicated budgeting is required. Contact the DPIF for further information.

As a rule of thumb, a GM of between \$150 - \$250/ha is required for a broadacre farm in the Douglas-Daly region to breakeven (ie to cover overhead costs). Cattle enterprises can operate profitably at much lower GMs/ha. The requirement for specialty cropping areas is variable. In general, a large component of overhead costs may be loan repayments and interest charges.

Once the techniques of farm budgeting have been mastered, they become second nature in evaluating the <u>uncertain outcomes</u> that a farmer faces. Budgeting after all, is merely attaching dollar values to those decisions that need to be made during the production process. Very few people in the farming game today are in a position where they don't need to keep a close eye on their finances.

The alternative option, making decisions on the basis of gut-feeling or guess-timation, seems foolhardy, especially under the deteriorating terms of trade faced by farmers these days.

2. WHAT IS A GROSS MARGIN?

A <u>gross margin</u> is the difference between <u>gross income</u> and total <u>variable costs</u> for a <u>farm</u> activity.

The total gross margin for a farm is the sum of all individual activity gross margins.

<u>Gross Income</u> can be measured by total receipts received from the sales of produce plus the value of any retained output.

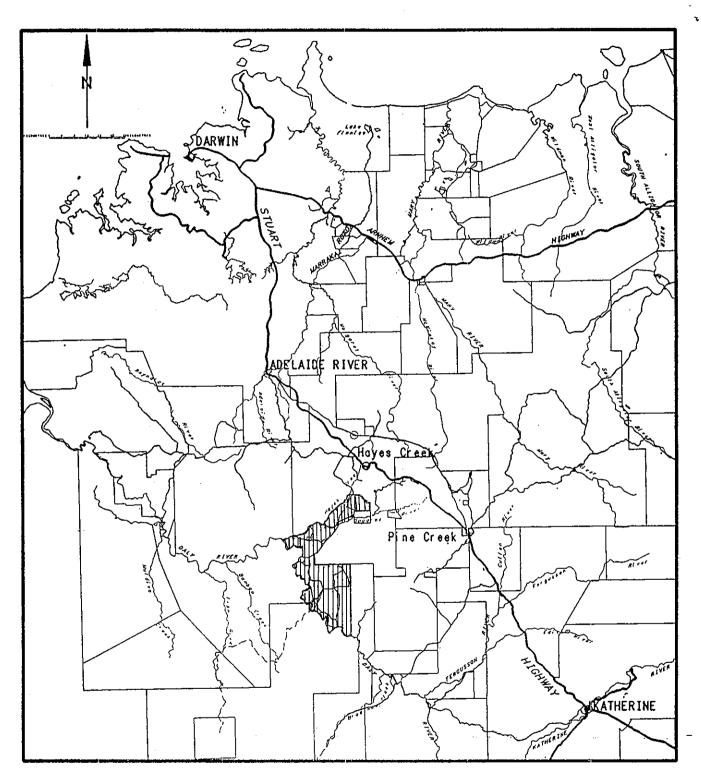

<u>Variable Costs</u> (also known as running costs). As the name implies, these costs vary with the size of farm activities. For example, if the area sown to sorghum is increased from 200 hectares to 400 hectares then roughly twice the amount of seed and fertiliser will be required. Other variable costs include: fuel, oil and repair and maintenance to machinery; casual labour costs; weed and pest control; harvesting and marketing costs. Variable costs are distinct from overhead costs.

Farm Activity refers to the particular method employed in producing a commodity. For example, minimum tillage maize and conventional tillage maize are two different farm activities. Both, however, are described by the more general expression of a maize enterprise.

Overhead Costs (or fixed costs). These costs are difficult to avoid each year and are unlikely to vary with changes in the levels of different farm activities, unless some capital expenditure is required for these changes to occur. Overhead costs include the wages of permanent workers, living expenses of the family, finance costs, insurance, telephone, replacement of buildings and machines, business expenses, rates and land taxes. Overhead costs plus variable costs represent total costs.

The relationship between the total gross margin and farm overhead costs provide a useful guide when computed on a per hectare basis. The average gross margin per hectare should be greater than the average overheads per hectare for the farm to make money.

Gross margins alone do not provide a basis for farm planning. Crop rotations, demands on farm labour, finance, risk and other constraints need to be considered in the context of farm objectives. Gross margins are simply the most commonly used, first-step, budgeting technique.

THE DOUGLAS DALY REGION

3. THE DOUGLAS-DALY REGION

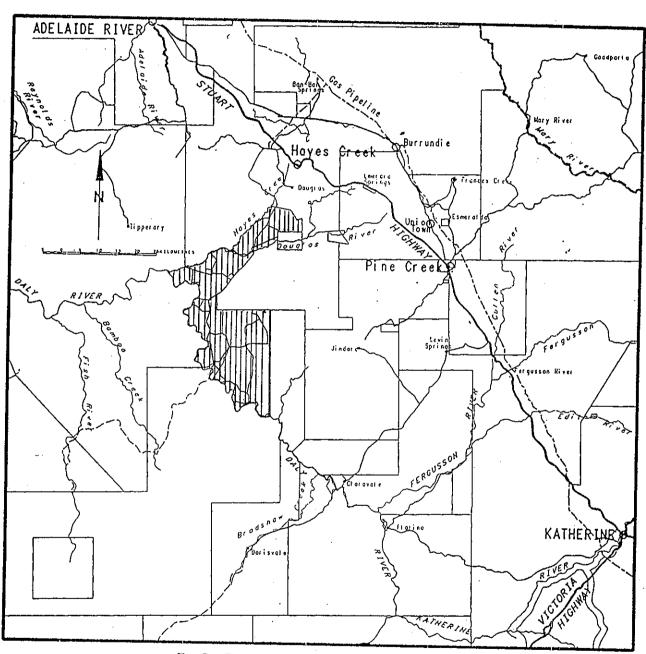

The area surrounding the junction of the Douglas and Daly river systems has been the major crop growing area in the Northern Territory in recent years. The general location of the region is given in Figure 1, and in more detail in Figure 2. The other major cropping area in the NT is around Katherine.

Cropping on a broadacre scale was initiated on Tipperary Station in the 1960's. It was not until the early 1980's, however, that major new agricultural developments occurred. The initiative came from the NT government, which acquired 20,000 hectares of Douglas Station and subsequently the whole of Oolloo and Fish River Stations. The Douglas-Daly and Oolloo acquisitions were subdivided into individual farm lots each comprising approximately 1,000 hectares of arable land and larger areas of non-arable scrub, resulting in blocks ranging in size from 4,500 to 14,000 hectares. The attractiveness of the region was considered to be its relatively good soils (commonly known as 'Blain' and 'Tippera' soil types), permanent water, proximity to the Douglas-Daly Research Farm and road access. Available soil water, soil temperatures, erosion factors and soil fertility (Williams, Day, Isbell and Reddy, 1985) have been considered the limiting agronomic factors in farm production to date.

Arable land areas in the region were cleared and farmed either under contract to then Agricultural Development and Marketing Authority (ADMA), or in some cases independently, after purchasing the land from the government.

In 1992-93 there are six broadacre farms in the Douglas-Daly acquisition area, all of which are now operating independently of government. Most of the farms now have mixed farming enterprises with grain forage crops, cattle and improved pastures.

Crop production in the NT is still at development phase and is small relative to the Australian States. The farmers readily testify that broadacre - scale farming in the semi-arid tropics is quite a challenge, and there is very little experience world-wide to draw upon. An appraisal of the long term economic potential for the industry would be premature at this stage without more experience and results in the field. Farm-gate production costs seem likely to remain higher than most Australian States, however, there are cost advantages in proximity to the local and Asian markets. Current local demand for stockfeed grains and pulses remain unmet, whilst there is interstate and export market potential for some of the high value crops from the NT (especially sesame, peanuts and mungbeans).

LOCATION MAP Douglas - Daly

4. SOME COMMENTS ON THE STANDARDISED BUDGETS

(a) Not all machinery costs are included in the gross margins. Only repairs and maintenance costs to machinery plus fuel and oil costs are included. All other costs, including depreciation, interest, provision of shelter, operators labour and insurance costs are treated as overhead costs. The ability to cover this latter group of costs is usually measured by preparing a whole farm budget.

The fuel, oil, and repair and maintenance bill was calculated as an average of 10,000 rated hours of use from tractors purchased new and 1,200 - 2,400 rated hours use from new implements. This is merely a simple accounting technique. Individual growers should have better idea of their own fuel, oil, repairs and maintenance costs. Actual machinery running costs for a particular farm may be much higher if old, worn-out equipment is used.

Fuel cost have been budgeted at 44¢/L. This is net of the NT government tax rebate and the customs and excise rebate for on-farm use.

- (b) Seeding rates will vary, depending on the weight of seed, germination percentage and individual's sowing practices.
- (c) Fertiliser rates should be varied with the nutrient status of the soil and particular crop requirements. Ask your district agronomist if you need advice on this matter.

The NT fertiliser freight subsidy for 1992-93 has been approved at \$95.00/ tonne or actual freight cost (whichever is lower). Claims should be submitted before June 1993. The minimum claim is for 2 tonnes, the maximum is 300 tonnes per producer.

- (d) Herbicide and pesticide application rates vary with climate, incidence of insects, etc. It is illegal to use any herbicide or pesticide that is not registered for use in the NT and to use registered chemical contrary to their label specifications. Contact the DPIF for further information if required.
- (e) The NT Grain Marketing Board has grain storage, grading and marketing facilities at Katherine and a storage facility at Douglas-Daly. The functions of the Board are to aquire, process, treat, market and generally deal with commodities grown or produced in the NT and to administer the Marketing Scheme for commodities declared and vested in the Board. The crops currently declared and vested in the Board are grain sorghum and maize. The Board announces indicative prices for most crops prior to the beginning of the cropping season. Payment for vested crops is made in instalments. The first advance, based on the indicative price, is paid soon after delivery and the final adjustment, including interest charges, is paid when the grain is sold.

(f) Trade names are used in this publication solely for the purpose of providing specific information. Mention of a registered trade name does not constitute a guarantee or warranty of the product by DPIF, nor does it endorse the product over brand names not mentioned. Trade names have been included because producers seem to identify more readily with these than with chemical names.

Notes 1.

Columns F and P provide estimates used in the standardised GM budgets.

Reductions in field operating efficiency occur due to; turning at the end of a paddock, failure to use full implement width, time taken to load seed and fertiliser, unloading of harvested crops, minor adjustments and repairs and lubrication whilst in the field.

Actual header speed and efficiency will vary for each crop.

R&M costs are expressed as a percentage of the new purchase price. The fuel price is calculated net of fuel rebates.
